

## Banker's Algorithm Example Solutions

### Exercise 1

Assume that there are 5 processes,  $P_0$  through  $P_4$ , and 4 types of resources. At  $T_0$  we have the following system state:

Max Instances of Resource Type A = 3 (2 allocated + 1 Available)

Max Instances of Resource Type B = 17 (12 allocated + 5 Available)

Max Instances of Resource Type C = 16 (14 allocated + 2 Available)

Max Instances of Resource Type D = 12 (12 allocated + 0 Available)

| Given Matrices       |                                                                          |    |    |    |                                                                  |   |   |   |                                                    |   |   |   |
|----------------------|--------------------------------------------------------------------------|----|----|----|------------------------------------------------------------------|---|---|---|----------------------------------------------------|---|---|---|
|                      | <u>Allocation Matrix</u><br>(No of the allocated resources By a process) |    |    |    | <u>Max Matrix</u><br>Max resources that may be used by a process |   |   |   | <u>Available Matrix</u><br>Not Allocated Resources |   |   |   |
|                      | A                                                                        | B  | C  | D  | A                                                                | B | C | D | A                                                  | B | C | D |
| <b>P<sub>0</sub></b> | 0                                                                        | 1  | 1  | 0  | 0                                                                | 2 | 1 | 0 | 1                                                  | 5 | 2 | 0 |
| <b>P<sub>1</sub></b> | 1                                                                        | 2  | 3  | 1  | 1                                                                | 6 | 5 | 2 |                                                    |   |   |   |
| <b>P<sub>2</sub></b> | 1                                                                        | 3  | 6  | 5  | 2                                                                | 3 | 6 | 6 |                                                    |   |   |   |
| <b>P<sub>3</sub></b> | 0                                                                        | 6  | 3  | 2  | 0                                                                | 6 | 5 | 2 |                                                    |   |   |   |
| <b>P<sub>4</sub></b> | 0                                                                        | 0  | 1  | 4  | 0                                                                | 6 | 5 | 6 |                                                    |   |   |   |
| <b>Total</b>         | 2                                                                        | 12 | 14 | 12 |                                                                  |   |   |   |                                                    |   |   |   |

#### 1. Create the need matrix (max-allocation)

$Need(i) = Max(i) - Allocated(i)$

(i=0)  $(0,2,1,0) - (0,1,1,0) = (0,1,0,0)$

(i=1)  $(1,6,5,2) - (1,2,3,1) = (0,4,2,1)$

(i=2)  $(2,3,6,6) - (1,3,6,5) = (1,0,0,1)$

(i=3)  $(0,6,5,2) - (0,6,3,2) = (0,0,2,0)$

(i=4)  $(0,6,5,6) - (0,0,1,4) = (0,6,4,2)$

Ex. Process P1 has max of (1,6,5,2) and allocated by (1,2,3,1)

$Need(p1) = max(p1) - allocated(p1) = (1,6,5,2) - (1,2,3,1) = (0,4,2,1)$

| Need Matrix = Max Matrix<br>– Allocation Matrix |   |   |   |   |
|-------------------------------------------------|---|---|---|---|
|                                                 | A | B | C | D |
| <b>P<sub>0</sub></b>                            | 0 | 1 | 0 | 0 |
| <b>P<sub>1</sub></b>                            | 0 | 4 | 2 | 1 |
| <b>P<sub>2</sub></b>                            | 1 | 0 | 0 | 1 |
| <b>P<sub>3</sub></b>                            | 0 | 0 | 2 | 0 |
| <b>P<sub>4</sub></b>                            | 0 | 6 | 4 | 2 |

#### 2. Use the safety algorithm to test if the system is in a safe state or not?

##### a. We will first define work and finish:

Initially work = available = ( 1, 5, 2, 0)

Finish = False for all processes

| Finish matrix  |       |
|----------------|-------|
| P <sub>0</sub> | False |
| P <sub>1</sub> | False |
| P <sub>2</sub> | False |
| P <sub>3</sub> | False |
| P <sub>4</sub> | False |

| Work vector |   |   |   |
|-------------|---|---|---|
| 1           | 5 | 2 | 0 |

##### b. Check the needs of each process [ $needs(pi) \leq Max(pi)$ ], if this condition is true:

- Execute the process , Change Finish[i] =True
- Release the allocated Resources by this process
- Change The Work Variable = Allocated (pi) + Work

**need<sub>0</sub> (0,1,0,0) <= work(1,5,2,0)**

P0 will be  
executed because  
need(P0) <= Work  
P0 will be True

| Finish matrix            |             |
|--------------------------|-------------|
| <b>P<sub>0</sub> - 1</b> | <b>True</b> |
| P <sub>1</sub>           | False       |
| P <sub>2</sub>           | False       |
| P <sub>3</sub>           | False       |
| P <sub>4</sub>           | False       |

P0 will release the allocated  
resources(0,1,1,0)  
Work = Work  
(1,5,2,0)+Allocated(P0)  
(0,1,1,0) = 1,6,3,0

| Work vector |   |   |   |
|-------------|---|---|---|
| 1           | 6 | 3 | 0 |

**Need<sub>1</sub> (0,4,2,1) <= work(1,6,3,0) Condition Is False P1 will Not be executed**

**Need<sub>2</sub> (1,0,0,1) <= work(1,6,3,0) Condition Is False P2 will Not be executed**

**Need<sub>3</sub> (0,0,2,0) <= work(1,6,3,0) P3 will be executed**

P3 will be  
executed because  
need(P3) <= Work  
P3 will be True

| Finish matrix            |             |
|--------------------------|-------------|
| <b>P<sub>0</sub> - 1</b> | <b>True</b> |
| <b>P1</b>                | False       |
| P <sub>2</sub>           | False       |
| <b>P<sub>3</sub> -2</b>  | <b>True</b> |
| P <sub>4</sub>           | False       |

P3 will release the allocated  
resources (0,6,3,2)  
Work = Work  
(1,6,3,0)+Allocated(P3)  
( 0,6,3,2) = 1,12,6,2

| Work vector |    |   |   |
|-------------|----|---|---|
| 1           | 12 | 6 | 2 |

**Need<sub>4</sub> (0,6,4,2) <= work(1,12,6,2) P4 will be executed**

P4 will be  
executed because  
need(P4) <= Work  
P4 will be True

| Finish matrix            |             |
|--------------------------|-------------|
| <b>P<sub>0</sub> - 1</b> | <b>True</b> |
| <b>P1</b>                | False       |
| P <sub>2</sub>           | False       |
| <b>P<sub>3</sub> -2</b>  | <b>True</b> |
| <b>P<sub>4</sub> -3</b>  | <b>True</b> |

P4 will release the allocated  
resources (0,0,1,4)  
Work = Work  
(1,12,6,2) + Allocated(P4)  
(0,0,1,4) = 1,12,7,6

| Work vector |    |   |   |
|-------------|----|---|---|
| 1           | 12 | 7 | 6 |

**Need<sub>1</sub> (0,4,2,1) <= work(1,12,7,6) P1 will be executed**

P1 will be  
executed because  
need(P1) <= Work  
P1 will be True

| Finish matrix            |             |
|--------------------------|-------------|
| <b>P<sub>0</sub> - 1</b> | <b>True</b> |
| <b>P<sub>1</sub> -4</b>  | <b>True</b> |
| P <sub>2</sub>           | False       |
| <b>P<sub>3</sub> -2</b>  | <b>True</b> |
| <b>P<sub>4</sub> -3</b>  | <b>True</b> |

P1 will release the allocated  
resources (1,2,3,1)  
Work = Work  
(1,12,7,6) + Allocated(P1)  
(1,2,3,1) = 2,14,10,7

| Work vector |    |    |   |
|-------------|----|----|---|
| 2           | 14 | 10 | 7 |

**Need<sub>2</sub> (1,0,0,1) <= work(2,14,10,7) P2 will be executed**

P2 will be  
executed because  
need(P2) <= Work  
P2 will be True

| Finish matrix            |             |
|--------------------------|-------------|
| <b>P<sub>0</sub> - 1</b> | <b>True</b> |
| <b>P<sub>1</sub> -4</b>  | <b>True</b> |
| <b>P<sub>2</sub> -5</b>  | <b>True</b> |
| <b>P<sub>3</sub> -2</b>  | <b>True</b> |
| <b>P<sub>4</sub> -3</b>  | <b>True</b> |

P2 will release the allocated  
resources (1,3,6,5)  
Work = Work  
(2,14,10,7) + Allocated(P1)  
(1,3,6,5) = 3,17,16,12

| Work vector |    |    |    |
|-------------|----|----|----|
| 3           | 17 | 16 | 12 |

The system is in a safe state and the processes will be executed in the following order:  
P0,P3,P4,P1,P2

**Exercise 2:**

If the system is in a safe state, can the following requests be granted, why or why not? Please also run the safety algorithm on each request as necessary.

- a. P1 requests (2,1,1,0)

We cannot grant this request, because we do not have enough available instances of resource A.

- b. P1 requests (0,2,1,0)

There are enough available instances of the requested resources, so first let's pretend to accommodate the request and see the system looks like:

|                | Allocation |   |   |   | Max |   |   |   | Available |   |   |   | Need Matrix    |   |   |   |   |
|----------------|------------|---|---|---|-----|---|---|---|-----------|---|---|---|----------------|---|---|---|---|
|                | A          | B | C | D | A   | B | C | D | A         | B | C | D |                | A | B | C | D |
| P <sub>0</sub> | 0          | 1 | 1 | 0 | 0   | 2 | 1 | 0 | 1         | 3 | 1 | 0 | P <sub>0</sub> | 0 | 1 | 0 | 0 |
| P <sub>1</sub> | 1          | 4 | 4 | 1 | 1   | 6 | 5 | 2 |           |   |   |   | P <sub>1</sub> | 0 | 2 | 1 | 1 |
| P <sub>2</sub> | 1          | 3 | 6 | 5 | 2   | 3 | 6 | 6 |           |   |   |   | P <sub>2</sub> | 1 | 0 | 0 | 1 |
| P <sub>3</sub> | 0          | 6 | 3 | 2 | 0   | 6 | 5 | 2 |           |   |   |   | P <sub>3</sub> | 0 | 0 | 2 | 0 |
| P <sub>4</sub> | 0          | 0 | 1 | 4 | 0   | 6 | 5 | 6 |           |   |   |   | P <sub>4</sub> | 0 | 6 | 4 | 2 |

Now we need to run the safety algorithm:

Initially

| Work vector | Finish matrix  |       |
|-------------|----------------|-------|
| 1           | P <sub>0</sub> | False |
| 3           | P <sub>1</sub> | False |
| 1           | P <sub>2</sub> | False |
| 0           | P <sub>3</sub> | False |
|             | P <sub>4</sub> | False |

Let's first look at P<sub>0</sub>. Need<sub>0</sub> (0,1,0,0) is less than work, so we change the work vector and finish matrix as follows:

| Work vector | Finish matrix  |       |
|-------------|----------------|-------|
| 1           | P <sub>0</sub> | True  |
| 4           | P <sub>1</sub> | False |
| 2           | P <sub>2</sub> | False |
| 0           | P <sub>3</sub> | False |
|             | P <sub>4</sub> | False |

Need<sub>1</sub> (0,2,1,1) is not less than work, so we need to move on to P<sub>2</sub>.

Need<sub>2</sub> (1,0,0,1) is not less than work, so we need to move on to P<sub>3</sub>.

Need<sub>3</sub> (0,0,2,0) is less than or equal to work.  
Let's update work and finish:

| Work vector | Finish matrix  |       |
|-------------|----------------|-------|
| 1           | P <sub>0</sub> | True  |
| 10          | P <sub>1</sub> | False |
| 5           | P <sub>2</sub> | False |
| 2           | P <sub>3</sub> | True  |
|             | P <sub>4</sub> | False |

Let's take a look at Need<sub>4</sub> (0,6,4,2). This is less than work, so we can update work and finish:

| Work vector | Finish matrix  |       |
|-------------|----------------|-------|
| 1           | P <sub>0</sub> | True  |
| 10          | P <sub>1</sub> | False |
| 6           | P <sub>2</sub> | False |
| 6           | P <sub>3</sub> | True  |
|             | P <sub>4</sub> | True  |

We can now go back to  $P_1$ .  $Need_1 (0,2,1,1)$  is less than work, so work and finish can be updated:

| Work vector | Finish matrix |       |
|-------------|---------------|-------|
| 1           | $P_0$         | True  |
| 14          | $P_1$         | True  |
| 10          | $P_2$         | False |
| 7           | $P_3$         | True  |
|             | $P_4$         | True  |

Finally,  $Need_2 (1,0,0,1)$  is less than work, so we can also accommodate this. Thus, the system is in a safe state when the processes are run in the following order:

$P_0, P_3, P_4, P_1, P_2$ . We therefore can grant the resource request.

**Exercise 3**

Assume that there are three resources, A, B, and C. There are 4 processes  $P_0$  to  $P_3$ . At  $T_0$  we have the following snapshot of the system:

|                | Allocation |   |   | Max |   |   | Available |   |   |
|----------------|------------|---|---|-----|---|---|-----------|---|---|
|                | A          | B | C | A   | B | C | A         | B | C |
| P <sub>0</sub> | 1          | 0 | 1 | 2   | 1 | 1 | 2         | 1 | 1 |
| P <sub>1</sub> | 2          | 1 | 2 | 5   | 4 | 4 |           |   |   |
| P <sub>2</sub> | 3          | 0 | 0 | 3   | 1 | 1 |           |   |   |
| P <sub>3</sub> | 1          | 0 | 1 | 1   | 1 | 1 |           |   |   |

1.Create the need matrix.

|                | Need |   |   |
|----------------|------|---|---|
|                | A    | B | C |
| P <sub>0</sub> | 1    | 1 | 0 |
| P <sub>1</sub> | 3    | 3 | 2 |
| P <sub>2</sub> | 0    | 1 | 1 |
| P <sub>3</sub> | 0    | 1 | 0 |

2. Is the system in a safe state? Why or why not?

In order to check this, we should run the safety algorithm. Let's create the work vector and finish matrix:

| Work vector | Finish matrix |       | Need <sub>0</sub> (1,1,0) is less than work, so let's go ahead and update work and finish: |
|-------------|---------------|-------|--------------------------------------------------------------------------------------------|
| 2           | $P_0$         | False |                                                                                            |
| 1           | $P_1$         | False |                                                                                            |
| 1           | $P_2$         | False |                                                                                            |
|             | $P_3$         | False |                                                                                            |
| Work vector | Finish matrix |       |                                                                                            |
| 3           | $P_0$         | True  |                                                                                            |
| 1           | $P_1$         | False |                                                                                            |
| 2           | $P_2$         | False |                                                                                            |
|             | $P_3$         | False |                                                                                            |

Need<sub>1</sub> (3,3,2) is not less than work, so we have to move on to  $P_2$ .

| Need <sub>2</sub> (0,1,1) is less than work, let's update work and finish: |  |               |       | Need <sub>3</sub> (0,1,0) is less than work, we can update work and finish: |  |               |       |
|----------------------------------------------------------------------------|--|---------------|-------|-----------------------------------------------------------------------------|--|---------------|-------|
| Work vector                                                                |  | Finish matrix |       | Work vector                                                                 |  | Finish matrix |       |
| 6                                                                          |  | $P_0$         | True  | 7                                                                           |  | $P_0$         | True  |
| 1                                                                          |  | $P_1$         | False | 1                                                                           |  | $P_1$         | False |
| 2                                                                          |  | $P_2$         | True  | 3                                                                           |  | $P_2$         | True  |
|                                                                            |  | $P_3$         | False |                                                                             |  | $P_3$         | True  |

We now need to go back to  $P_1$ . Need<sub>1</sub> (3,3,2) is not less than work, so we cannot continue. Thus, the system is not in a safe state.
